0.0 Original Premise

A bunch of sneaks climb into a dungeon in order to make some cash, which they have promised to split based on an arcane series of rules known only to them. Sneaking in is easy; getting out is the tricky part!

Players each control a Hauler -- a gnome, sprite, halfling, or dwarf -- who is trying to move as much treasure out of the Dungeon as possible. In the Treasure room, players can pick up as many treasures as they like, and then navigate traps as they escape.

The game is a sidescroller, allowing players to run, jump and interact. They'll encounter pits, spike traps, shock traps, crushing block traps, switches and gates which they'll have to navigate to escape. Players hit by traps are stunned momentarily, and lose some or all over their treasure load temporarily (like Sonic, dropping his rings, only the treasure only disappears if a trap removes it, like pits) and must recollect it -- if another player doesn't first.

Players actions:

- $\Leftarrow / \Rightarrow$ Run
- $\Downarrow$ Pick Up Treasure / duck
- A Jump
- B Trip / Push (Empty Handed)
- B + $\Downarrow$ Drop first treasure
- B + $\Uparrow$ Throw first treasure

The dungeon is split up into sections, which fork. Each time the players finish a section, they arrive at a fork, and must decide which way to go next. Each fork shows two exits, themed after what they can expect in the next area. Players can press left/right to choose a path, then tap a and b rapidly to "argue"; whichever path has more arguments (more button presses) wins, and they party goes down that path.

On exit, the game tallies player scores, in two ways.

First, it determines the value of the haul:

- Ordinary Treasure is worth 1 each
- Each gold treasure is worth 5
- Each chest is opened to reveal a random treasure; these are never duplicates of recovered unique items, but may be spawn unique items lost in the dungeon
- Each Gem is worth 10
- Equipment has varying values
- Some items come in sets of 3 to 5 pieces; if the whole set is recovered, the value of each piece is ignored over the value of the whole set.

Second, it determines how many shares each player gets:

- +5 Shares for exiting
- +3 shares for recovering treasure
- +5 Shares for fastest time
- +3 Shares for biggest haul
- +1 Share for each item hauled
- +1 Share for each item in a set recovered

- +5 Shares for perfect run (no traps hit)
 - +1 Share for compassionate (Never hit an opponent)
 - +2 Shares for biggest jerk (hit the most opponents)
 - -1 Share for Empty Handed
 - +2 Shares for Realist (Exiting with the same number of treasures as you started with)
 - +4 Shares for Opportunist (Exiting with at least two more treasures than you started with)
 - -2 Shares for Butterfingers (Lost the most treasure)
-
- All Treasures of one type
 - All Chests

A player's take is equal to **[Total Treasure] x ([Their Share] / [Total Shares])**.

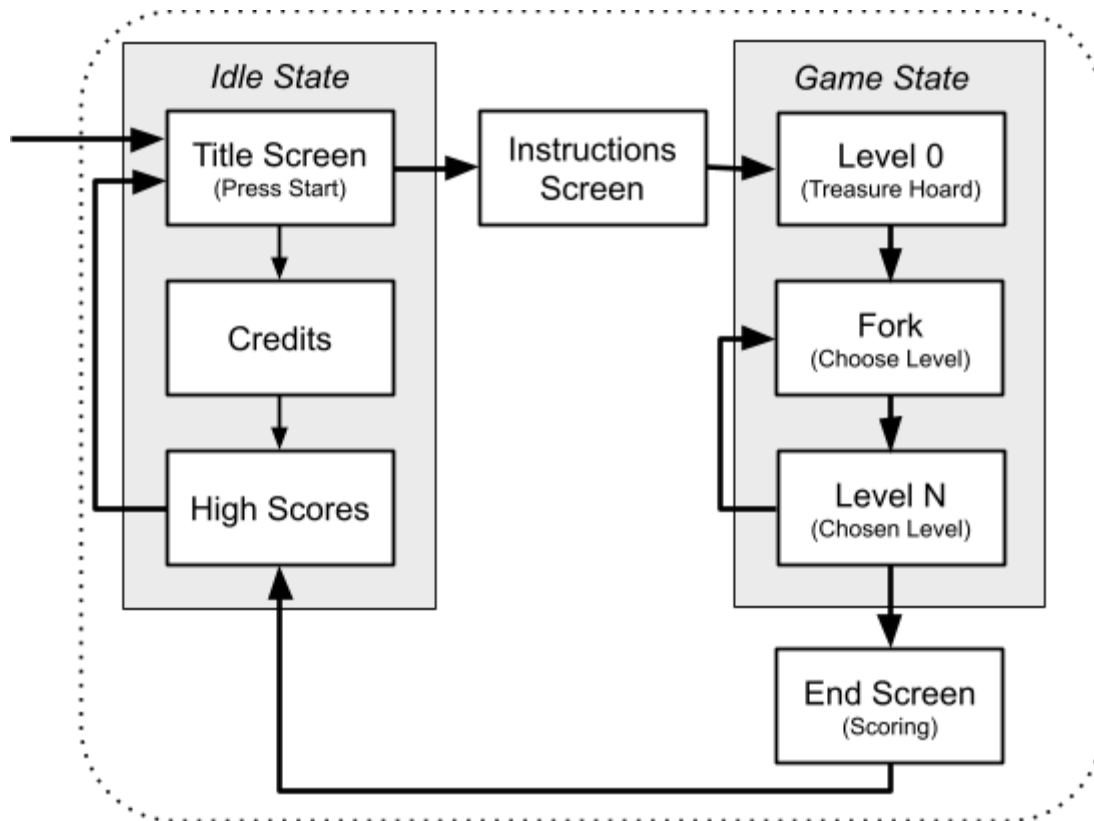

0.1 Document Consideration Notes

Design Doc Considerations

- Structure: Game Loops; Screen Progressions

 - Treasure Table
 - Shares Table
 - Level Designs
 - Screen Design & Layouts, Zooming
- Sound Design & Consideration
- Assets Lists
 - Graphic Assets
 - Sound Assets
 - Text and Other Assets

1.0 Game Structure

1.1 Game Loop

The game moves between a few basic loops. When the game launches, it begins with the Idle State, which progresses as follows:

- Title Screen, which after idling goes to
- The Credits, which after idling goes to
- The High Scores, which after idling goes back to the Title Screen

During the Idle State, if any button is pressed on any controller, it skips back to the Title Screen, or to the Instructions if already on the Title Screen.

The Instructions screen is an isolated version of the Game State, with some unique qualities.

The Game State consists of two main screens:

- Levels, and
- Forks

The Game State starts by dropping the players into Level 0 (The Treasure Hoard); players progress to the right edge of the screen. When all players exit the screen, they proceed to the Fork screen.

The Fork is a different kind of screen; players cannot run freely around on it, but instead pick between two options

for the next level. The game loops between Levels and Forks until the players have completed 7 Levels, at which point the game progresses to the End Screen.

On the End Screen, group and player score is determined, and if players achieve a High Score, they're given a chance to enter their name in the High Score table. Once the End Screen is resolved, the loop returns to the Idle State, jumping directly to the High Scores screen.

1.2 Title Screen

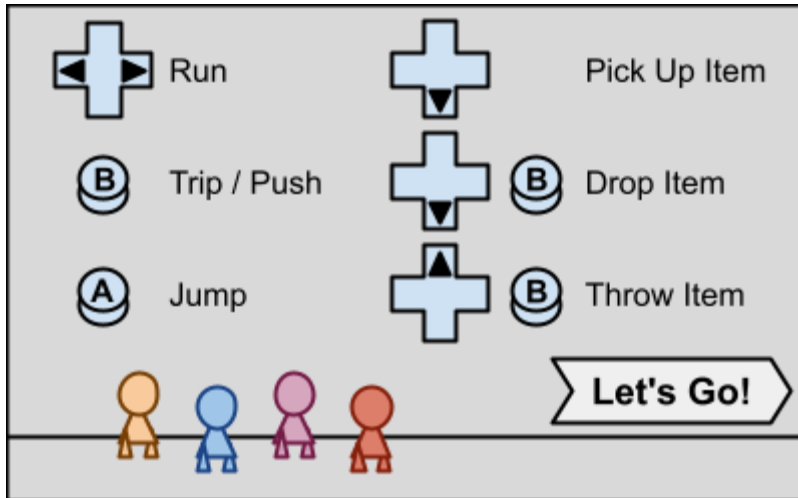

The game launches to the Title screen. It's simply a big splash screen with the title.

It includes a simple animation of the game's characters, and instruction to press a button to start.

- The background on this screen scrolls at a constant rate.
- When the screen loads, the characters are off screen (on the left), then move right into the centre of the screen (as depicted)
- While idling on this screen, the characters should vary their position slightly.
- When transitioning to the next screen, the characters should run off screen to the right, then fade to black.
- If anyone presses any button the game moves to the Instructions Screen.
- If no buttons are pressed after 10 seconds, the game moves to the High Scores Screen.

1.3 Instructions Screen

The Instructions Screen is a full game screen. When a character's controller is active (a button pressed recently, not under AI control), they'll be dropped in to the Instructions Screen. Players can acclimatize to the control scheme, and once they're ready, they can exit to the right.

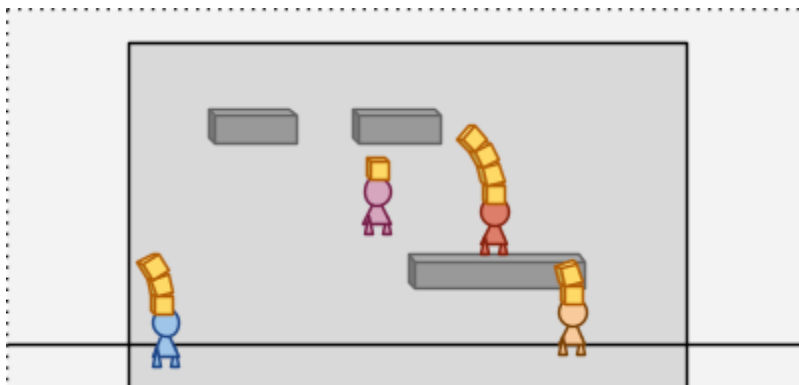

The screen is very minimalistic, with few details for the ground or background besides the basics to give shape to the space. The bulk of the background will be taken up with a diagram of the games controls.

Once all active players exit the screen, the game progresses into the game state.

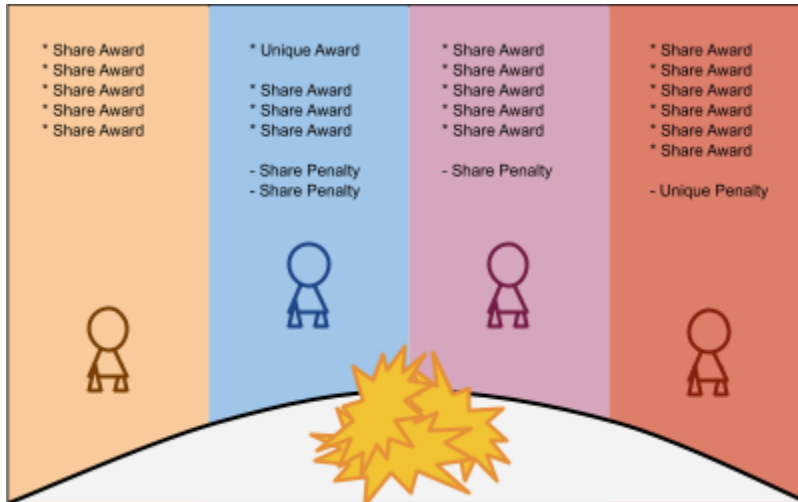

Some unique qualities of the Instructions Screen:

- The screen is fixed; no camera scrolling or zooming
- AI characters don't appear
 - If a player becomes inactive, they are removed from the screen
 - If a player becomes active, they drop in from the top-left side of the screen

1.4 Game State

1.5 End Screen

The End Screen is all about showing players the results of their play through. It takes place in three key steps:

- Counting the Haul
- Determining Shares
- Awarding the Spoils

The each step goes as follows:

Counting the Haul

- Fade in from black
- Each character exits the Dungeon (in the same order they reached the exit)
 - The character run away from the Dungeon for a moment
 - The camera pans to follow
 - Characters stop, standing in a circle around a central point as depicted
- Each character tosses their treasure one by one in the the pile
 - Each character goes one at a time, starting with the slowest character and going to the fastest
 - As each item is tossed, the Gold Piece Value is show above the pile
 - As each item is tossed, it's name is show below the pile
 - As each item's value is shown, the total haul for each character is show below them
 - If an item tossed into the pile completes a set, then a pop-out should appear above the pile, showing the complete set, it's name, and the completion bonus.
 - If multiple players contributed to completing the set, they should all be awarded an appropriate portion of the completion bonus
- Once all the treasure is tossed in the pile, the total will flash briefly; a fanfare will play if the haul is higher than the total hauls on the highscore list.

Determining the Shares

- One at a time, the Share Modifier titles are displayed for each player
 - In the same order as Counting (slowest to fastest) players have their titles shown

- A stylized panel appears behind the character; one by one, titles are listed
- Share Modifier titles are listed in the following order
 - Unique Rewards (Gold)
 - Common Rewards (White)
 - Common Penalties (Blue)
 - Unique Penalties (Red)
- The values of the modifiers is NOT shown
- The list should scroll if there are too many entries.
- Once all the titles are shown, below each character we display their share percentage
 - The Percentages are shown one by one, in the order of 3rd, 2nd, 4th, 1st.
 - Sound should be played to reflect the placement, and perhaps a vocalization for each character

Awarding the Spoils

- After the Shares have been shown the characters move to the Treasure pile
- All at once, each character begins to rummage through the pile
- As they rummage, their take appears above their head, counting up until the pile is depleted
- Starting with the character with the smallest take, each character should step back, with their total final take displayed above them in large text.
- Any character who sets a high score is then given the option to enter their name
 - Players are given 60 seconds to complete an entry
 - AI players are (obviously) not eligible

After all scores are displayed and any high scores are entered, any button pressed (or waiting 10 seconds) will move the game to the High Scores screen.

1.6 Credits

A simple screen that briefly displays an animated graphic showing off the team.

Information on this page should include:

- Each Team Member's name (or pseudonym)
- Each Team Member's Role(s)
- Any additional info for each team member (Twitter Handle, Website, whatever)
- Any quote or call out desired for each team member
- Dedications, special thanks or any additional notes
- **Made at TOJam 8** should appear somewhere here

Waiting on the Credits screen for 5 seconds will move to the High Scores Screen. Pressing any button will move to the Title Screen.

1.7 High Scores

Greatest Hauls

1		Jim 31% 258, 820 GP	2		Greg 27% 221, 210 GP		
3		Megan 36% 220, 300 GP	4		Herr Zoot 22% 218, 440 GP		
New! 5		Lindsey 28% 195, 740	6		Andrew 40% 188, 880		
	27% 195, 740		Lindsey 28% 202, 990		24% 173, 990		21% 152, 240

The High Scores screen shows a list of the best scores accomplished by players.

The screen will show:

- The Top 25 Scores (Name, Character, Take, Share Percentage)
- The Last Score set (Name, if entered, Take per Character)
- The Last Three Highscores set will be highlighted, and tagged with a “New!” image

When the screen loads, it will:

- Start at the bottom of the list
- Pause for 1 second
- Scroll slowly to the top of the list
- Pause for 1 second

Then the screen will return to the Title Screen; pressing a button at any time will skip immediately to the Title Screen.

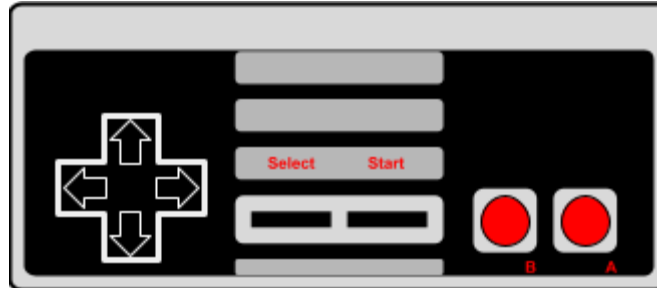

2.0 Mechanics and Gameplay

2.1 Players and Interactions

Controls

Player controls break down into four schemes for different scenarios. Outside the game, During Levels, At Forks, and During Endscreen.

The control scheme is designed with the original NES controller in mind:

This means inputs of:

- D-Pad: 4 Direction Buttons
- Two Menu Buttons: Start, Select
- Two Action Buttons: A, B

Outside The Game

- Any Start Game (When on Title Screen)
Go to Title Screen (When Elsewhere)

During Level

- Any Drop-in (When AI Controlled)
- $\leftarrow / \rightarrow$ Run / Steer (in air)
- $\downarrow$ Duck / Pick Up Treasure
- A Jump
- B Trip / Push (Empty Handed)
- B + $\downarrow$ Drop a treasure
- B + $\uparrow$ Throw a treasure
- Start Pause Game

During Fork

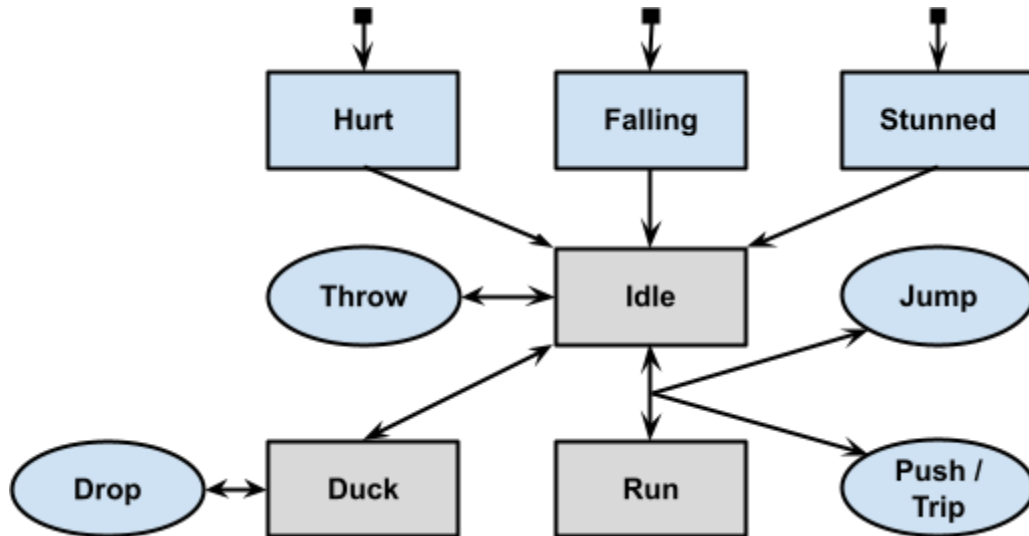

- $\uparrow / \downarrow$ Select Path
- A / B "Discuss" (Once Path is Selected)

During Endscreen

- $\uparrow / \downarrow$ Select Letter
- $\leftarrow / \rightarrow$ Select Character Slot
- A Enter Character / Confirm Entry (Once Entry is Full)

- B Delete Character
- Start Skip Animation / Confirm Entry

Animation Model

Players have a fairly rigid animation model:

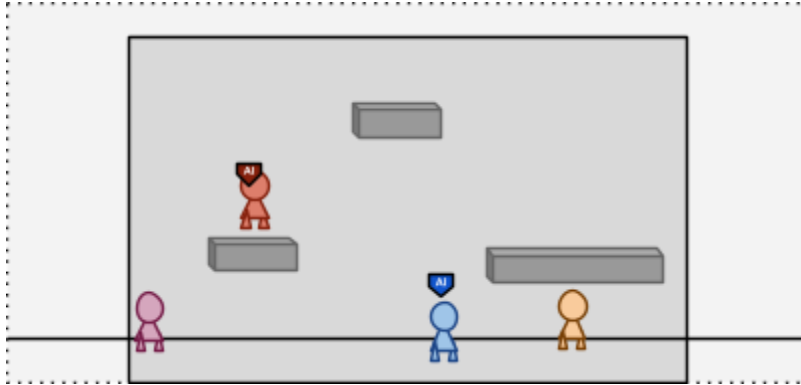

- Blue states are involuntary
- Round states loop back to their originating states
- Some states (Hurt, Stunned, Falling) are compelled regardless of current state

Drop-in/Drop-out Multiplayer

During the course of the game, players can drop in and drop out spontaneously. No matter what, there are always 4 characters active during the Game State.

- If an AI Player's controller has any button pressed, they will immediately be activated, and the human player will take control.
- A Human Player will revert to an AI controller automatically if:
 - No buttons on their controller are pressed in 20 seconds, or;
 - No buttons are pressed in 5 seconds, and the character is pressed against the edge of the camera

AI Players

AI players are there to keep the game moving and compelling even when there are less than 4 players.

AI players follow very simple behaviors:

- The AI player will attempt to stand in between all Human players
 - Average the position of all players
 - Tolerate a difference of up to 25% of the distance between the two furthest characters.
- The AI player will pick up any treasure that is near them
 - AI players will not carry more treasures than the most carried by a Human Player
 - AI players will drop or toss a lesser treasure to pick up a more valuable one
- AI players will attempt to press any switch or button

2.2 Treasures

Treasures litter the game in a specific proportion, based on the kind of treasure:

- 65% Common Treasures
- 20% Rare Treasures
- 05% Unique Treasures
- 10% Set Treasures

Unique Treasures and Set Treasures never appear in doubles; if a Unique or Set treasure is lost or left behind during the game, it can be found again in later stages, or in Chests at the end of the game.

Additionally, there is a trade off in picking up treasures. After the first three treasures, players see a cumulative decrease in their speed and jump height, and each treasure increases their total weight (which affects knock back, and interactions with certain blocks, such as Switches and Crumbling Blocks).

List of Common Treasures

Value	Name	
5 gp	Stone Icon	
20 gp	Coin Sack	<i>(Doesn't get added to the stack)</i>
20 gp	Brass Watch	
50 gp	Bronze Icon	
50 gp		
75 gp	Gold Watch	
100 gp	Big Coin Sack	<i>(Doesn't get added to the stack)</i>
100 gp	Silver Icon	

150 gp	Sculpture	
200 gp	Giant Coin Sack	<i>(Doesn't get added to the stack)</i>
??? gp	Wooden Chest	<i>(Random Common or Rare treasure)</i>
??? gp	Silver Chest	<i>(Random Common, Rare or Unique Treasure)</i>

List of Rare Treasures

Value	Name	
250 gp	Gold Icon	
350 gp		
500 gp	Gemstone	
750 gp	Crown	
800 gp	Marble Icon	
??? gp	Gold Chest	<i>(Random Rare, Unique or Set Treasure)</i>
??? gp	Magic Chest	<i>(Last item in an almost complete set, else a Unique Treasure)</i>

List of Unique Treasures

Value	Name
800 gp	Goat Icon
800 gp	Supply Crate
900 gp	Giant's Ring
1000 gp	NES Cartridge
1000 gp	Magic Scepter
1000 gp	? Block
1200 gp	Ruby Crown
1200 gp	E-Tank
1500 gp	Crystal Skull
1500 gp	Magic Hourglass

List of Treasure Sets

Value	Set Bonus	Name
150 gp	+ 10%	[4] Suit of Armor: Helmet, Breastplate, Greaves, Gauntlets
300 gp	+ 200%	[4] HAUL Icons
300 gp	+ 150%	[3] Celestial Markers: Sun Sculpture, Moon Sculpture, Star Sculpture
250 gp	+ 50%	[4] Divine Suits: Spade, Club, Heart, Diamond
500 gp	+ 50%	[2] Song of Fire and Ice: Flame Guitar, Ice Bass
300 gp	+ 500%	[5] The "Box" set: andrew, greg, lindsey, megan, aaannddd darius icons :-)
50 gp	+ 2000%	[4] Vegetables: Turnip, Green Pepper, Pumpkin, Onion

2.3 Share Modifiers

At the end of the game, each player gets a number of Share Modifiers which alter how much of the group's haul they're entitled to. No matter the breakdown, a player is always entitled to 1 share, minimum.

Share modifiers are tagged in two ways: They're either Rewards or Penalties; and they're either Unique or Common.

In order to award Share Modifiers to players, we need to track a wide variety of statistics on each player from the beginning to the end of each play session.

Share Rewards

Modifier	Name	Conditions
+10	Leader of the Pack	Always the first to exit each Level
+5	Breadwinner	Brought in the most Treasure
+3	Airhead	Had the most airtime
+3	Landshark	Had the least airtime
+1	Jammy	Brought back the Goat on a Pole
+x	Haul	+1 for each Treasure recovered
+x	Collector	+1 for each Set Treasure in a completed set recovered
+5	My Precious	Carried exactly one treasure from the Hoard to the Exit
+5	Success!	Successfully exited the Dungeon
+5	Flawless	Was never stunned or injured during the game
+5	Gambler	Only recovered Chests
+3	Disciplinarian	Hit each other player
+2	Opportunist	Finished with at least +2 treasures more than when you left the Hoard
+1	Softie	Never hit another player
+1	Precision	Exited with the same number of treasures as when you left the Hoard

Share Penalties

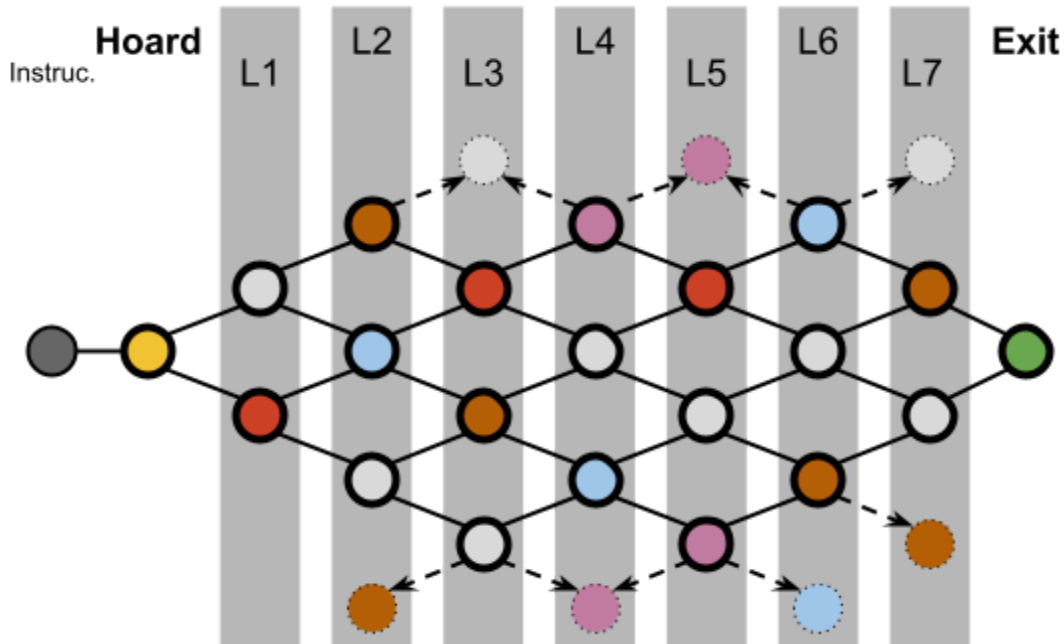

Modifier	Name	Conditions
-1	Slowpoke	Always the last to exit a stage
-3	Butterfingers	Lost the most treasures
-3	Klutz	Hit the most traps
-3	Whipping Boy	Took the most hits from other players
-5	Big Jerk	Hit the most other players
-7	Antisocial	Only Human player for the duration of the game
-1	Unremarkable	Had no unique share modifiers, good or bad!
-1	Remedial Archaeology	Lost a Set item during the escape
-2	Attention Deficit	Switched between an AI and Human controller more than 5 times
-2	Greed Overwhelming	Had your movement speed dropped to 0 from carried treasure
-3	Empty Handed	Left the Dungeon with no treasure
-5	Undiscerning	Exited with only common treasures
-5	Autopilot	Controlled by an AI player for more than half the game

2.4 Game Screens, Layouts and Cameras

Game viewport (Total usable size of window: xyz by prq)

3.0 Levels

3.1 Path Diagram

Above is a diagram of the proposed level progression. Here is how it breaks down:

- Every game consists of 7 Levels, plus the Instructions, Hoard Room, and Exit
- Each game always begins in the Instruction room, and through to the Hoard Room, after which players get choices
 - Players always have the choice of two possible levels in the next leg of the dungeon
 - There are 19 different Levels, of which players get their choice of about 75% of them each game, with only one level ruled out in each level in Levels 2 through 6
- Colors represent Level themes
 - **Gold** Hoard
 - **Green** Outside
 - **Grey** Dungeon
 - **Red** Lava
 - **Blue** Ice
 - **Brown** Cavern
 - **Purple** Mist

As time is a concern with this project, It is recommended to design the levels in the following fashion:

1. Build Instructions and Hoard Room, and have a game-end state functioning
2. Build one Level; ensure that game state resolves properly
3. Add Levels two at a time to give choices between each leg, until there are 14 levels ($2 * 7$)
4. Add Missing legs to Levels 2-6 one by one
5. Time permitting, expand level selection

An alternative possibility is:

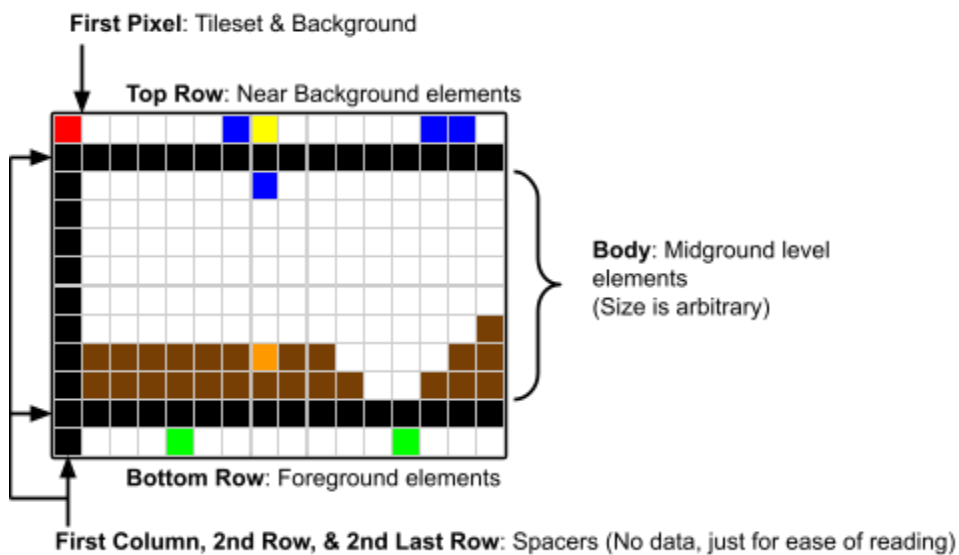

- Ditch pathed levels entirely; at the end of each level, the fork presents two random levels the players have not played yet (or repeats if there aren't enough levels)
- Level progression is mostly random

3.2 Level Descriptions

Levels are made up of a grid of blocks with each block being xx pixels square.

Level Format

Image where 1 Pixel = 1 Block

Color	Block Type
Red	Switch

3.3 Level Features

Levels are comprised of a pile of elements, described below:

Blocks

Blocks are solid, square level elements that make up the bulk of each level.

Block Name	Description
Brick	Nothing special
Ice	Slippery; friction reduced on these blocks
Sand	Rough terrain; friction increased on these blocks

Switch	A big button on the ground which activates nearby devices
Heavy Switch	A big button on the ground which activates nearby devices Requires extra weight to activate -- 3 unloaded players or less with treasure

Treasure

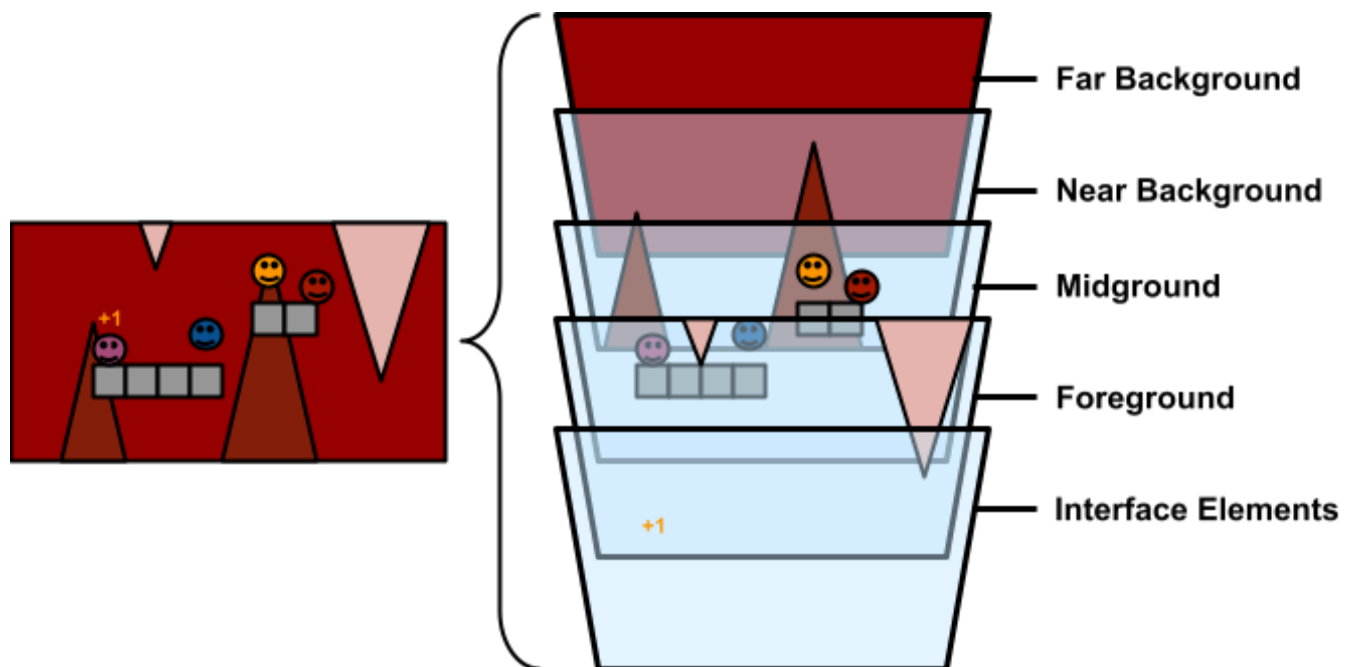

Treasure is scattered about each level. The position of each piece of treasure is predetermined by the level data, but the type of treasure placed is determined randomly -- see Section 2.2 for further details.

Traps

Traps are blocks which generally make life harder of the players.

Trap Name	Description
Spikes	A pile of sharp spikes
Crumbling Brick	A weakened brick that can only support a limited weight
Receding Block	A brick that vanished from underfoot a moment after being stepped on
Cycling Lightning Trap	Fires a bolt of energy every few seconds
Activated Lightning Trap	Fires a bolt of energy when activated by switch
Activated Gas Trap	Lets loose a billow of gas that stuns players
Falling Rock Trap	Drops a stone down; the stone bounces briefly whenever it hits a block, damages Crumbling Blocks, activates switches, stuns players, Golems and Phantom Hands
Golem	A stone monster that wander around and attacks players It can be stunned with thrown treasure or by being jumped on
Phantom Hand	A ghostly hand which drops from the ceiling, attempting to steal treasure from players Players can chase it off by hitting it with thrown treasure or by jumping on it

Decorative Features

Levels also have a number of decorative elements that are strictly visual, which are layered in the visuals. They include the Far Background, Near Background, and Foreground. For additional reference, there are two other layers, the Midground and the Interface Layer, which fit in this structure.

Each layer is described below, from furthest back to farthest forward:

- **The Far Background** is either a repeating background image or a large scrolling image that is displayed behind all other elements. It scrolls at a reduced rate compared to the players and game elements in the Midground. (50%?)
- **The Near Background** is made of small, individual elements that fill the level height; it appears between the midground and Far Background. The Near Background scrolls at the same rate as the midground.
- **The Midground** is the space that all the vital level elements occupies; this is where the players, blocks, traps and other elements interact with each other.
- **The Foreground** is like the Near Background, in that it is also made of elements that fill the level height; it appears between the Midground and Interface elements. The Foreground scrolls at a slightly faster rate than the Midground. (125%?)
- **The Interface** is where any display text or numbers should show up; because these elements are supposed to be indicators to the players, they should appear in front of any other elements

4.0 Sound Design

Discuss: Music Format?

4.1 Music

- Title Screen
- Credits Screen
- High Scores Screen
- Instructions Screen
- Level Music
 - Horde Room
 - Fork "Discussion"
 - Dungeon Level
 - Lava Level
 - Ice Level
 - Cavern Level
 - Mist Level
- Ending Music

4.2 Character Sounds

The game features four characters: The Gnome, Halfling, Sprite and Dwarf. Each character has the same controls and behaviors, so the only differences between them are their visuals and audio, though they all have the same types of assets.

Each Character has unique sounds for the following:

- Hurt
- Stunned
- Fell off Screen
- Arguing (At least three "exclamations")
- Jump
- Picked up Treasure
- Picked up Unique or Set Treasure

Each Character uses a generic sound for the following:

- Picked up Coin bag
- Landing on the ground
- Throwing an Object
- Dropping an Object
- Pushing
- Tripping

4.3 Object Sounds

A number of objects make a variety of sounds throughout the game; because objects do that.

Common Objects

- Object Impact
- Regular Switch Click down
- Regular Switch Click up
- Heavy Switch Click down
- Heavy Switch Click up

Traps

- Crumbling Block Straining
- Crumbling Block Breaking
- Receding Block sliding in
- Receding Block sliding out
- Lightning Zap
- Gas Release

- Golem Stomping
- Golem Attacking
- Golem Stunned
- Phantom Hand Dropping
- Phantom Hand Escaping
- Phantom Hand Hurt

4.4 Interface Sounds

Idle State

- "Skip to Title" Sound
- "Start Game" Sound

Ending Scene

- Counting Treasure
- Counting Unique Treasure
- Treasure Set Complete
- Count Complete Fanfare

- Unique Reward received
- Unique Penalty received
- Common Reward or Penalty Received
- 1st Place award
- 2nd Place award
- 3rd Place award
- 4th Place award

- Rummaging through Treasure from the Pile
- 1st place finished taking treasure
- 2nd place finished taking treasure
- 3rd place finished taking treasure
- 4th place finished taking treasure

- Highscore awarded
- Highscore: Change character beep
- Highscore: Enter character beep
- Submitted entry sound
